1 Mars Rovers

1.1 PAGE Description

• Percept: Detect terrain, atmospheric conditions, and chemical composition

• Action: Navigating terrain, collecting samples, transmitting data

• Goal: Explore Martian surface and gather scientific data

• Environment: Extraterrestrial landscape (Mars)

1.2 Environmental Characteristics Analysis

| Characteristic | Classification | Argument |
|-------------------|----------------|---|
| Accessible vs In- | INACCESSIBLE | The sensors cannot provide complete |
| accessible | | state information about the vast Mar- |
| | | tian environment. Hidden obstacles, |
| | | subsurface conditions, and distant ter- |
| | | rain remain unknown. Weather condi- |
| | | tions and dust storms can obscure visi- |
| | | bility. |
| Deterministic | NON- | Weather patterns (dust storms) are un- |
| vs Non- | DETERMINISTIC | predictable. Equipment failures can |
| deterministic | | occur randomly. Terrain conditions |
| | | may change due to weather or seismic |
| | | activity. Communication success de- |
| | | pends on atmospheric conditions. |
| Episodic vs Non- | NON-EPISODIC | Current actions affect future capabili- |
| episodic | | ties (battery usage, equipment wear). |
| • | | Sample collection locations influence |
| | | future exploration paths. Previous ex- |
| | | ploration data guides subsequent mis- |
| | | sion decisions. |
| Static vs Dy- | DYNAMIC | Weather conditions change continu- |
| namic | | ously. Dust accumulation affects so- |
| | | lar panel efficiency. Temperature vari- |
| | | ations affect equipment performance. |
| | | Terrain may change due to dust storms. |
| Discrete vs Con- | CONTINUOUS | Infinite possible positions and orien- |
| tinuous | | tations. Continuous sensor readings |
| | | (temperature, pressure, etc.). Contin- |
| | | uous motion control and navigation. |
| | | Analog sensor data processing. |
| With/Without | WITHOUT AD- | No intelligent opponents on Mars. |
| Adversaries | VERSARIES | Challenges come from environmental |
| | | factors, not strategic opponents. |

Table 1: MARS Robot Environmental Characteristics

1.3 Recommended Agent Architecture

GOAL-BASED AGENT

Rationale:

- Mars robots must work toward specific scientific objectives (goals)
- Must plan complex sequences of actions for sample collection and analysis
- Need to consider future consequences of current actions
- Must adapt plans based on changing environmental conditions
- Communication delays prevent real-time human control, requiring autonomous goaldirected behavior

2 Obstacle Avoidance Robot

2.1 PAGE Description

• Percept: Recognizes obstacles

• Action: Moving left, right, forward.

• Goal: Avoiding obstacles

• Environment: Room

2.2 Environmental Characteristics Analysis

| Characteristic | Classification | Argument |
|-------------------|----------------|---|
| Accessible vs In- | INACCESSIBLE | Sensors have limited range and field of |
| accessible | | view. Obstacles may be hidden behind |
| | | other objects. Cannot simultaneously |
| | | monitor all directions. Some obstacles |
| | | may be outside sensor detection range. |
| Deterministic | NON- | Dynamic obstacles (people, animals) |
| vs Non- | DETERMINISTIC | move unpredictably. Sensor readings |
| deterministic | | may have noise and uncertainty. Envi- |
| | | ronmental conditions (lighting) can af- |
| | | fect sensor performance. |
| Episodic vs Non- | EPISODIC | Each obstacle avoidance action is rel- |
| episodic | | atively independent. Previous obsta- |
| | | cle encounters don't significantly im- |
| | | pact current decisions. Each moment |
| | | of navigation can be treated as a sepa- |
| | | rate episode. |
| Static vs Dy- | DYNAMIC | Moving obstacles change positions |
| namic | | continuously. People and animals |
| | | move unpredictably. Lighting condi- |
| | | tions may change. Environmental lay- |
| | | out may be modified. |
| Discrete vs Con- | CONTINUOUS | Infinite possible positions and orien- |
| tinuous | | tations. Continuous sensor readings |
| | | (distance, speed). Smooth motor con- |
| | | trol and movement. Analog sensor |
| | | data processing. |
| With/Without | WITHOUT AD- | Obstacles are not trying to strategically |
| Adversaries | VERSARIES | interfere with the robot. People and |
| | | animals move for their own purposes, |
| | | not to challenge the robot. |

Table 2: Obstacle Avoidance Robot Environmental Characteristics

2.3 Recommended Agent Architecture

SIMPLE REFLEX AGENT with INTERNAL STATE

Rationale:

- Obstacle avoidance primarily requires immediate reactive responses
- Fast reaction time is crucial for safety

- Simple condition-action rules are sufficient: "If obstacle detected at distance X, then move(left, right, forward)/turn/stop"
- Internal state needed to track current position and recent movements to avoid getting stuck
- Episodic nature means complex long-term planning is unnecessary
- Real-time response requirements favor simple, fast decision-making over complex reasoning
